Orbital (!) approximation

Assign electrons to **one-electron** waves; for historical reasons these are called **orbitals** (yikes!).

This assignment **would be exact** if electrons did not **repel one another**.

Because **electron clouds are diffuse**, repulsion is **relatively small** and so the orbital approximation is a **good starting point**.

Orbital size and shielding

When there is more than one electron, the one-electron-atom energy formula can be generalized to

$$\text{Orbital energy} = -13.6 \text{ eV } Z_{\text{eff}}^2 / n^2$$

where Z_{eff} is the **effective nuclear charge**.

Z_{eff} is smaller than the number of protons, to take into account **shielding (cancellation)** of some of the protons charge by other electrons that are closer to the nucleus.

23

Lecture 33 CH101 A1 (MWF 9 am) Fall 2016

Copyright © 2016 Dan Dill dan@bu.edu

Orbital size and shielding

The approximate size of the orbital is

$$\text{Orbital size} \approx 50 \text{ pm } n^2 / Z_{\text{eff}}$$

This means ...

the **more loops**, the **bigger** the orbital cloud, and ...

the **larger** Z_{eff} , the **smaller** the orbital cloud.

24

Lecture 33 CH101 A1 (MWF 9 am) Fall 2016

Copyright © 2016 Dan Dill dan@bu.edu

Orbital size and shielding

The ionization energy of the orbital is

$$\begin{aligned} IE_{\text{orbital}} &= E_{\infty} - (-13.6 \text{ eV } Z_{\text{eff}}^2 / n^2) \\ &= 0 + 13.6 \text{ eV } Z_{\text{eff}}^2 / n^2 \\ &= 13.6 \text{ eV } Z_{\text{eff}}^2 / n^2 \end{aligned}$$

The **smaller** Z_{eff} and the **larger** n , the **more easily** the electron can be ionized.

The goal: Why $1s^22s$ and not $1s^22p$

The Li atom electron configuration $1s^22s$ is more stable than $1s^22p$.

The reason is, the $2s$ electron feels a greater nuclear charge, Z_{eff} , than does the $2p$ electron.

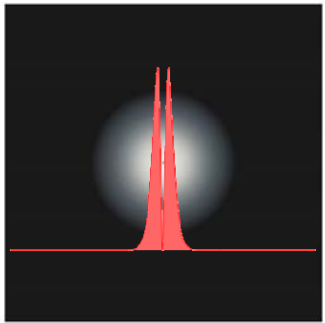

The following illustrations (<http://goo.gl/hMNPLA>) show qualitatively why this is so.

BOSTON UNIVERSITY

$$IE_1 = 13.6 \text{ eV } Z_{\text{eff}}^2/n^2$$

47

Lecture 30 CH101 A2 (MWF 11 am) Fall 2015

Copyright © 2015 Dan Dill dan@bu.edu

Li $1s^3$?

Not possible, since at least two electrons would have the **same spin in the same orbital**.

Such an electron wave **vanishes everywhere** and so there can be **no atom with this configuration**.

53

Lecture 30 CH101 A2 (MWF 11 am) Fall 2015

Energy order of relative spins (Pauli)

Key point: "spin" = **magnetic moment**, either up or down

$\uparrow\uparrow$ **never**; $\uparrow\downarrow$ (**worst**) > $\uparrow \dots \downarrow$ > $\uparrow \dots \uparrow$ (**best**)

54

Lecture 30 CH101 A2 (MWF 11 am) Fall 2015

Copyright © 2015 Dan Dill dan@bu.edu

Li $1s^2 2s$ or $1s^2 2p$?

The $2s$ **inner loop escapes the shielding** of the $1s^2$ part of the electron cloud.

The $2p$ has no inner loop and so would be **more shielded** by the $1s^2$ part of the electron cloud.

Hence, the $2s$ electron experiences slightly **greater nuclear charge** (Z_{eff}) and so it is **more tightly held** than the $2p$ electron would be.

So, $1s^2 2s$ is **more stable** than $1s^2 2p$

55

Lecture 30 CH101 A2 (MWF 11 am) Fall 2015

Copyright © 2015 Dan Dill dan@bu.edu

Be $2s^2$ or $2s 2p$?

$2s^2$ are in **same orbital** and so must have **greater electron-electron repulsion**

But, the $2s$ inner loops result in **greater nuclear attraction** than the $2p$.

Nuclear attraction trumps electron repulsion, and so $2s^2$ is more stable.

56

Lecture 30 CH101 A2 (MWF 11 am) Fall 2015

Copyright © 2015 Dan Dill dan@bu.edu

B $2s^3$ or $2s^2 2p_x$ or $2s^2 2p_y$ or $2s^2 2p_z$? $2s^3$ is **not possible** for the same reason as $1s^3$ is not.Either $2s^2 2p_x$ or $2s^2 2p_y$ or $2s^2 2p_z$ are **possible and equivalent**.

57

Lecture 30 CH101 A2 (MWF 11 am) Fall 2015

Copyright © 2015 Dan Dill dan@bu.edu

C $2p_x^2$ or $2p_x 2p_y$? $2p_x^2$ are in **same orbital** and so must have **greater** electron-electron **repulsion**

What about electrons in different 2p orbitals?

58

Lecture 30 CH101 A2 (MWF 11 am) Fall 2015

Copyright © 2015 Dan Dill dan@bu.edu

Energy order of relative spins (Pauli)Key point: "spin" = **magnetic moment**, either up or down $\uparrow\uparrow$ **never**; $\uparrow\downarrow$ (**worst**) > $\uparrow \dots \downarrow$ > $\uparrow \dots \uparrow$ (**best**) $\uparrow\downarrow$ (**worst**): Electrons in **same spatial region** (orbital) and so **repel** one another **the most** $\uparrow \dots \downarrow$: Electrons **clump** together (**Fermi clump**) in **different spatial regions** (orbitals) and so **repel somewhat less** $\uparrow \dots \uparrow$ (**best**): Electrons "**avoid**" one another (**Fermi hole**) and are in **different spatial regions** (orbitals) and so **repel one another the least**

59

Lecture 30 CH101 A2 (MWF 11 am) Fall 2015

Copyright © 2015 Dan Dill dan@bu.edu

C $2p_x^2$ or $2p_x 2p_y$? $2p_x^2$ are in **same orbital** and so must have **greater** electron-electron **repulsion**

What about electrons in different 2p orbitals?

 $2p_x 2p_y$ can have **spins parallel** and so **decreased** repulsion (Fermi hole).Both configurations have the **same nuclear attraction** (Z_{eff} and no inner loops).Hence $2p_x 2p_y$ (or $2p_x 2p_z$ or $2p_y 2p_z$) **more stable**.

61

Lecture 30 CH101 A2 (MWF 11 am) Fall 2015

Copyright © 2015 Dan Dill dan@bu.edu

N $2p_x^2 2p_y$ or $2p_x 2p_y 2p_z$?

In $2p_x^2 2p_y$ the $2p_x$ is in **same orbital** and so must have **greater electron-electron repulsion**

In $2p_x 2p_y 2p_z$ all spins are parallel and so there are **only Fermi holes** and so **reduced repulsion**.

Hence $2p_x 2p_y 2p_z$ is **more stable**.

62

Lecture 30 CH101 A2 (MWF 11 am) Fall 2015

Copyright © 2015 Dan Dill dan@bu.edu

O $2p_x 2p_y^2 2p_z$ or $2p_x 2p_y 2p_z 3s$?

$2p_x 2p_y^2 2p_z$ has **increased electron repulsion** (Fermi clump).

$2p_x 2p_y 2p_z 3s$ has **decreased electron repulsion** (Fermi hole).

$2p_x 2p_y^2 2p_z$ has **greater nuclear attraction** since the $n = 2$ orbitals are more bound than $n = 3$ orbitals.

Nuclear attraction trumps electron repulsion, and so $2p_x 2p_y^2 2p_z$ is more stable.

Successive ionization energies

		IE_n (eV)	
Ca	$3p^6 4s^2$	6	
Ca ⁺	$3p^6 4s^1$	12	
Ca ²⁺	$3p^6$	51	
Ca ³⁺	$3p^5$	67	
Ca ⁴⁺	$3p^4$	85	

BOSTON UNIVERSITY

81

Lecture 31 CH101 A2 (MWF 11 am) Fall 2015 Copyright © 2015 Dan Dill dan@bu.edu

Successive ionization energies

		IE_n (eV)	
Ca	$3p^6 4s^2$	6	
Ca ⁺	$3p^6 4s^1$	12	
Ca ²⁺	$3p^6$	51	
Ca ³⁺	$3p^5$	67	
Ca ⁴⁺	$3p^4$	85	

The largest change from one to the next is $IE_3 - IE_2 = 39$ eV.
Why is this change so large compare to the other successive changes?

BOSTON UNIVERSITY

82

Lecture 31 CH101 A2 (MWF 11 am) Fall 2015 Copyright © 2015 Dan Dill dan@bu.edu

Successive ionization energies

		IE_n (eV)	
Ca	$3p^6 4s^2$	6	
Ca ⁺	$3p^6 4s^1$	12	
Ca ²⁺	$3p^6$	51	
Ca ³⁺	$3p^5$	67	
Ca ⁴⁺	$3p^4$	85	

IE_2 has $n = 4$, whereas IE_3 , etc., have $n = 3$.
Fewer loops, less energy, more energy needed to ionize.

BOSTON UNIVERSITY

83

Lecture 31 CH101 A2 (MWF 11 am) Fall 2015 Copyright © 2015 Dan Dill dan@bu.edu

Successive ionization energies

		IE_n (eV)	Z_{eff}
Ca	$3p^6 4s^2$	6	2.7
Ca ⁺	$3p^6 4s^1$	12	3.7
Ca ²⁺	$3p^6$	51	5.8
Ca ³⁺	$3p^5$	67	6.7
Ca ⁴⁺	$3p^4$	85	7.5

There is also a big change in Z_{eff} going from Ca⁺ to Ca²⁺.
The electrons in the 3p subshell do not shield one another.

BOSTON UNIVERSITY

84
