[TP] For an hypothetical class, 75 students weigh 100 lbs, 100 students weigh 150 lbs, 50 students weigh 200 lbs. Roughly (guesstimate), what will the average weight be?

25% 1. Less than 100
 25% 2. Between 100 and 150
 25% 3. Between 150 and 200
 25% 4. Greater than 200

Lecture 2 CH101 A1 (MWF 9:05 am)
 Friday, September 8, 2017

For today ...

- Complete: Liquid volume of gas particles in SCI/109?
- Atoms, elements, and isotopes
- Isotopes → atomic weight

Next lecture: Chemist's dozen: The mole. Begin ch3: Naming things; molecular mass spectra

To memorize: Tables 3.2 and 3.4; Figures 3.7, 3.8, and 3.19 (see Handouts tab)

Liquid volume of the air in SCI/109

If all of the air in SCI/109 were condensed to liquid, how many 5 gallon containers would be required to hold the liquid air?

Mass of air & density of liquid air → volume of liquid air

Air composition by mass is
 75.5% N₂, 23.2% O₂, and 1.3% Ar (Google)

Liquid densities are
 0.808 g/cm³ N₂, 1.141 g/cm³ O₂, 1.3954 g/cm³ Ar (Google)

To keep the calculation simple, let's assume density of liquid air is about 1.0 g/cm³

Liquid volume of the air in SCI/109

If all of the air in SCI/109 were condensed to liquid, how many 5 gallon containers would be required to hold the liquid air?

Mass of air ≈ 2400 kg

Liquid air density ≈ 1.0 g/cm³

[Group quiz] If all of the air in SCI/109 were condensed to liquid, how many 5-gallon containers would be required to hold the liquid air?

0% 1. Much less than 1
0% 2. About 1
0% 3. About 5
0% 4. About 10
0% 5. Much more than 10

BOSTON UNIVERSITY 5

Liquid volume of the air in SCI/109

If all of the air in SCI/109 were condensed to liquid, how many 5 gallon containers would be required to hold the liquid air?

Mass of air $\approx 2400 \text{ kg}$
Liquid air density $\approx 1.0 \text{ g/cm}^3$
Volume of liquid air is about 600 gal ≈ 120 5-gallon containers!!!
So, while atoms are small, they take up space

Atoms, elements, isotopes

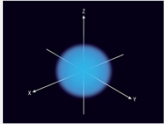

The world is made of atoms.
Atoms come in different kinds (elements)
Atoms of each kind come in different flavors (isotopes)

BOSTON UNIVERSITY 13

Atoms

Mostly *wispy*, nearly *empty*,
cloud of *negative charge (electrons)* $\approx 10^{-8}$ cm diameter

Nucleus: $\approx 10^{-12}$ cm diameter *extraordinarily dense*
sphere of *positive charge*

Positive charge due to *protons*

Mass \approx protons + neutral *neutrons*

Element identity and atomic number Z

sodium	22.98976928
19	
K	
potassium	39.0983
37	

Number of protons = *atomic number* $Z = 19$
Relative *atomic weight* = 39.0983
Where does the number *39.0983* come from?

BOSTON UNIVERSITY

Lecture 2 CH101 A1 (MWF 9:05 am) Fall 2017 Copyright © 2017 Dan Dill dan@bu.edu

Atoms of an element come in different “flavors”

Atoms with the same number of protons ...
but with different numbers of neutrons ...
are *chemically the same* ...
but have *different masses*

We call such different flavors of atoms of an element *isotopes*

39.0983 u is the *average mass* of the
different kinds of atoms (isotopes) of K
that are in a sample of K.

sodium	22.98976928
19	
K	
potassium	39.0983
37

Atomic mass unit u

1 u **defined** to be exactly (1/12) mass of 1 atom of ^{12}C

Exactly 12 g of ^{12}C contains $N_A = 6.02214 \times 10^{23}$ atoms

Therefore, the mass of one ^{12}C atom is ...

$$12 \text{ g} / N_A = 1.99265 \times 10^{-23} \text{ g}$$

And so, 1 u = ...

$$(1/12) \times 1.99265 \times 10^{-23} \text{ g} = 1.66054 \times 10^{-24} \text{ g}$$
