[TP] Identify the correct statement about the redox reaction
 $\text{Zn}^{2+}(aq) + \text{Cu}(s) \rightleftharpoons \text{Cu}^{2+}(aq) + \text{Zn}(s)$.

17% 1. $\text{Zn}^{2+}(aq)$ is the reducing agent because it gains electrons
 17% 2. $\text{Cu}(s)$ is the reducing agent because it gains electrons
 17% 3. $\text{Zn}^{2+}(aq)$ is the reducing agent because it loses electrons
 17% 4. $\text{Cu}(s)$ is the reducing agent because it loses electrons
 17% 5. $\text{Zn}^{2+}(aq)$ is the reducing agent because it is reduced
 17% 6. $\text{Cu}(s)$ is the reducing agent because it is reduced

BOSTON UNIVERSITY 1

Lecture 21 CH101 A1 (MWF 9:05 am)
 Wednesday, October 25, 2017

For today ...

- To memorize: Table 6.13, p 194: Common acids and bases
- Balancing oxidation-reduction equations
- Complexation as Lewis acid-base reaction

Begin ch7: Chemical reactions and energy flows

- First law of thermodynamics

Next lecture: System vs. surroundings; Detecting heat; Predicting sign of heat; Detecting work; Amount of heat depends on whether there is work

BOSTON UNIVERSITY

Memorize: Table 6.13: Common acids and bases

Strong Acids (Strong electrolytes)		Strong Bases (Strong electrolytes)	
HCl	Hydrochloric acid	LiOH	Lithium hydroxide
HBr	Hydrobromic acid	NaOH	Sodium hydroxide
HI	Hydroiodic acid	KOH	Potassium hydroxide
HNO_3	Nitric acid		
HClO_4	Perchloric acid		
H_2SO_4	Sulfuric acid		
Weak Acids (Weak electrolytes)*		Weak Bases (Weak electrolytes)*	
H_3PO_4	Phosphoric acid	NH_3	Ammonia
H_2CO_3	Carbonic acid	$\text{CH}_3\text{CH}_2\text{NH}_2$	Ethylamine
CH_3COOH	Acetic acid		
$\text{H}_2\text{C}_2\text{O}_4$	Oxalic acid		
$\text{H}_2\text{C}_6\text{H}_4\text{O}_6$	Tartaric acid		
$\text{H}_3\text{C}_6\text{H}_5\text{O}_7$	Citric acid		
$\text{HC}_9\text{H}_8\text{O}_4$	Aspirin		

* These are just a few common examples of the very many weak acids and weak bases.

Redox reactions: **Competition for e^-**

Oxidation-reduction reactions are a **competition for electrons**

Species that **gives up e^-** →
 is **oxidized** →
 It **makes possible reduction** →
 and so is called the **reducing agent**

BOSTON UNIVERSITY 5

Getting balanced redox (full) reaction

$$2 \text{Ag}^+(aq) + \text{Cu}(s) \rightleftharpoons 2 \text{Ag}(s) + \text{Cu}^{2+}(aq)$$

First, get the balanced half-reactions

Then, combine the half-reactions so that the electrons **released** in the oxidation are exactly **consumed** in the reduction ...

Lewis alternative definition of acids and bases

Lewis acid "accepts" a **pair of electrons** to form a covalent bond

Lewis base has a pair of electrons to form a covalent bond

Result is **acid-base adduct**

Lecture 21 CH101 A1 (MWF 9:05 am) Fall 2017 Copyright © 2016 Dan Dill dan@bu.edu

First law of thermodynamics

Energy, U , is exchanged between system and surroundings as heat, q , and work, w ,

$$\Delta U = q + w$$

Positive values increase energy of system

$$\Delta U = q + w$$

q = heat flow into the system
 w = done on the system

BOSTON UNIVERSITY

First law of thermodynamics

In a certain chemical reaction, 10 kJ of heat flow into the system and the system does 21 kJ of work on the surroundings. **Sketch the energy diagram** showing q , w , and ΔU for this reaction. Indicate the initial and final energy by horizontal lines labeled U_i and U_f , respectively.
