## Lecture 33 CH101 A2 (MWF 11:15 am)

Friday, December 1, 2017

For today ...

- Comment: H atom energy diagrams: Beyond Balmer's formula
- Ionization (photoelectric effect)
- Review: Lewis structures, formal charge and oxidation number

Next lecture: Review: Electron clouds; More than one electron: Orbital (yikes!) approximation; Electron shielding of one electron by others: <http://goo.gl/hMNPLA>; Building electron configurations

BOSTON UNIVERSITY

### Questions about the H atom

Question: Since the H atom has just one electron, isn't that electron always a **1s cloud**?

Answer: **No!**

The atom with the 1s cloud electron can absorb energy (a photon) from light of frequency

$$\nu = |E_{2p} - E_{1s}|/h, \text{ or } \nu = |E_{3p} - E_{1s}|/h, \text{ etc.},$$

and thereby the electron will be transformed into a **2p cloud**, or a **3p cloud**, etc.

Only if the atom emits any excess energy (a photon) will the electron be a 1s cloud.

### Questions about the H atom

Question: Since light transforms the 1s cloud into a p cloud, how can the electron be in a d cloud?

Answer: First, use light to form a p cloud, say as  $1s \rightarrow 2p$ .  
<http://quantum.bu.edu/CDF/101/1sTo2pTransition.cdf>

Then, use light to transform the p cloud into a d cloud,  
<http://quantum.bu.edu/CDF/101/2pyTo3dxyTransition.cdf>

When  $1p \rightarrow 3d$  transformation by light

When  $1p \rightarrow 3d$  transformation by light

## Questions about the H atom

**Question:** I see  $1s \rightarrow 2p$  and  $2p \rightarrow 3d$ , but how to get to  $2s$ ?

**Answer:** First, use light absorption to form a higher p cloud, say as  $1s \rightarrow 3p$ .

Then, light emission achieves  $3p \rightarrow 2s$ .

## Ionization

What happens if an H atom absorbs a photon of energy **greater than**

$$E_{\text{photon}} = E_{\text{cloud},\infty} - E_{\text{cloud},1} = \text{Ry} \left( -\frac{1}{\infty^2} + \frac{1}{1^2} \right) = \text{Ry}(0 + 1) = \text{Ry}?$$

8

## Ionization

The electron is **ejected** from the atom, leaving behind  $\text{H}^+$ .

This is called **ionization**, and ...

$$E_{\text{cloud},\infty} - E_{\text{cloud},1} = \text{Ry} \text{ is called the } \mathbf{ionization\ energy, IE}.$$

## Ionization

Since  $\Delta E_{\text{atom}} = -\Delta E_{\text{light}}$  and energy  $\Delta E_{\text{light}}$  has been **lost by the light**, ...

all energy **in excess of the ionization energy** is carried away as **electron kinetic energy, KE**,

$$\Delta E_{\text{atom}} = \mathbf{IE} + \mathbf{KE}$$

## Ionization

Sketch the energy diagram for ionization of an electron from  $\text{Li}^{2+}$  in its  $n = 6$  level by light of wavelength 310 nm.

Use your sketch to get the **algebraic expression** for the **kinetic energy** of the electron, using  $h$ ,  $c$ ,  $Ry$ , and 310 nm in your expression.

## Ionization

**Answer:** The ionization energy of  $\text{Li}^{2+}$  ( $n = 6$ ) is

$$IE = E_{\text{cloud},\infty} - E_{\text{cloud},6} = 0 + Ry\frac{3^2}{6^2} = \frac{Ry}{4}$$

The photon energy is

$$E_{\text{photon}} = \frac{hc}{310 \text{ nm}}$$

Therefore the kinetic energy of the electron is

$$KE = E_{\text{photon}} - IE = \frac{hc}{310 \text{ nm}} - \frac{Ry}{4} = 9.6 \times 10^{-20} \text{ J} = \mathbf{0.60 \text{ eV}}$$

[TP] What is the **ionization energy** of H atom electrons with these electron clouds?

- 0% 1. 13.6 eV  
 0% 2. 13.6/4 eV  
 0% 3. 13.6/9 eV  
 0% 4. 13.6/16 eV  
 0% 5. They have different ionization energies

[Quiz] Which hydrogen atom electron cloud has the **smallest** ionization energy?

1. Left  
 2. Middle  
 3. Right  
 4. They all have the **same** ionization energy
