The more different the χ 's, the more polar the bond

- If two bonded atoms are **different**, the one with **larger χ** gets **more** of the **shared electron cloud**
- Atom with **larger χ** has net **negative** charge; atom with **smaller χ** has net **positive** charge
- The larger the difference in χ , the greater the charge separation (unequal sharing of electron cloud)
- Result is a **polar bonds**

Molecular polarity

- If bond dipoles **cancel**, molecule is **nonpolar**
- If bond dipoles **do not** cancel, molecule is **polar**

(a) (b)

Let's illustrate, for BF_3 and BH_2F

Consider polarity of the following

- BFCl_2 , whose shape is **trigonal-planar**, like that of BF_3
- SCl_2 , which is a **bent** molecule, like H_2O
- NH_2Cl , whose shape is **trigonal-pyramidal**, like that of NH_3
- OCS , which is a **linear** molecule, like CO_2

[TP] Which of the following molecules are **not** polar?

17% 1. BFCl_2 , whose shape is **trigonal-planar**, like that of BF_3

17% 2. SCl_2 , which is a **bent** molecule, like H_2O

17% 3. NH_2Cl , whose shape is **trigonal-pyramidal**, like that of NH_3

17% 4. OCS , which is a **linear** molecule, like CO_2

17% 5. All of the above are **nonpolar**

17% 6. All of the above are **polar**

[Quiz] Which of the following statements is true about carbon dioxide, $O=C=O$?

25% 1. CO_2 contains polar bonds and is a polar molecule
 25% 2. CO_2 contains polar bonds, but is not a polar molecule
 25% 3. CO_2 does not contain polar bonds and is not a polar molecule
 25% 4. CO_2 does not contain polar bonds but is a polar molecule
