[TP] Red light emitted by H atoms has frequency $\nu_{\text{atom}} \sim 5 \times 10^{14}$ Hz. A typical IR frequency is $\nu_{\text{IR}} \sim 1 \times 10^{13}$ Hz. This means that, compared to the mass, m_{atom} , of what is moving in response to visible light, the moving mass in IR spectra, m_{IR} , is ...

BOSTON UNIVERSITY 1

Lecture 27 CH101 A1 (MWF 9:05 am)

Friday, November 9, 2018

Begin ch 8: Modeling atoms and their electrons

- Review: What light is and how it interacts with matter
- Natural frequencies of atoms
- Light and matter exchange energy smoothly and slowly
- Light energy is exchanged in tiny amounts called photons
- Using light-matter resonance frequencies to construct energy diagrams of matter

Next lecture: Electron waves and quantization (de Broglie) ; Hydrogen atom electron clouds

Prepare: Hydrogen atom family album, <https://goo.gl/XPkcxv>

Matter experiences light as an oscillating electric field

The electric field strength changes direction at frequency ν_{light} .
 (The effect of the magnetic field is **relatively negligible**.)

The changing electric field of light tugs on matter ...

Matter can respond to tugs only at “natural” frequencies of “motion” in matter

$$\nu_{\text{light}} = \nu_{\text{matter}}$$

What are natural frequencies of atoms?

There are four "lines", at 410 nm, 434 nm, 486 nm, and 656 nm.

BOSTON UNIVERSITY 10

Lecture 27 CH101 A1 (MWF 9:05 am) Fall 2018 Copyright © 2018 Dan Dill dan@bu.edu

What are natural frequencies of atoms?

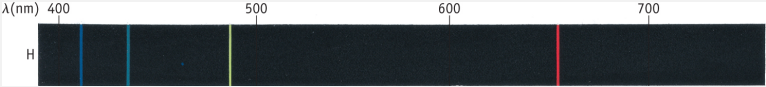

Since light interacts with matter when $\nu_{\text{light}} = \nu_{\text{matter}}$, these lines mean ...

there is **motion in the atom**
at the frequencies, ν_{atom} , corresponding to these lines.

BOSTON UNIVERSITY 11

Lecture 27 CH101 A1 (MWF 9:05 am) Fall 2018 Copyright © 2018 Dan Dill dan@bu.edu

What are natural frequencies of atoms?

What is the frequency of motion in the H atom corresponding to the 656 nm line?

$$\nu_{\text{atom}} = \frac{c}{\lambda_{\text{atom}}} = \frac{2.998 \times 10^8 \text{ m/s}}{656 \text{ nm}} = 4.57 \times 10^{14} \text{ s}^{-1} \sim 5 \times 10^{14} \text{ s}^{-1}$$

What are natural frequencies of atoms?

The red light emitted has frequency $\nu_{\text{atom}} \sim 5 \times 10^{14} \text{ Hz}$.

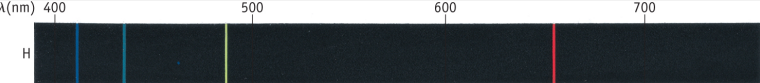

For IR, at typical frequency due to the oscillation of light atoms is $\nu_{\text{IR}} \sim 1 \times 10^{13} \text{ Hz}$.

Since **forces** in IR and in atoms are both **electrical**, **force constants are similar**.

What are natural frequencies of atoms?

Estimate the ratio of the mass of what is moving in H atom, m_{atom} , relative to the mass moving at $\sim 1 \times 10^{13}$ Hz, m_{IR} .

$$\nu_{\text{atom}}/\nu_{\text{IR}} \sim 50 = \sqrt{\frac{m_{\text{IR}}}{m_{\text{atom}}}}$$

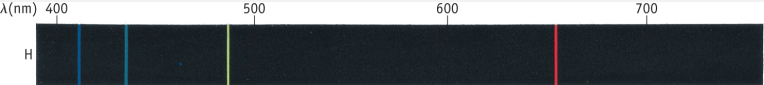

$$m_{\text{IR}}/m_{\text{atom}} \sim 50^2 \text{ so } m_{\text{IR}} \text{ is } \sim 2500 \text{ times heavier than } m_{\text{atom}}.$$

BOSTON UNIVERSITY

17

Lecture 27 CH101 A1 (MWF 9:05 am) Fall 2018 Copyright © 2018 Dan Dill dan@bu.edu

What are natural frequencies of atoms?

$m_{\text{IR}}/m_{\text{atom}} \sim 50^2$ so m_{IR} is ~ 2500 times heavier than m_{atom} .

So, **what is it that is moving** in the atom in response to visible light that is so much lighter than the atoms themselves moving in response to IR light?

Motion of electron clouds accounts for how atoms interact with light:

$$\nu_{\text{light}} = \nu_{\text{cloud}}$$

Resonant tugs by light on an electron cloud

Each oscillation takes about $1/\nu \sim 10^{-14}$ seconds (in visible region)

About 100,000 oscillations are required to complete the transformation

So about

$$10^{-14} \text{ s/osc} \times 10^5 \text{ osc} = 10^{-9} \text{ s}$$

are required to transform the **1s cloud** into the **2p cloud**.

Light energy is exchanged in tiny amounts called photons

BOSTON UNIVERSITY 38

Lecture 27 CH101 A1 (MWF 9:05 am) Fall 2018 Copyright © 2018 Dan Dill dan@bu.edu

Total energy exchanged is $h\nu_{\text{light}} = hc/\lambda_{\text{light}}$

This amount energy is called a photon.

BOSTON UNIVERSITY 39

Lecture 27 CH101 A1 (MWF 9:05 am) Fall 2018 Copyright © 2018 Dan Dill dan@bu.edu

$$\Delta E_{\text{light}} + \Delta E_{\text{atom}} = 0$$

Photon energy units are **exchanged** between light and atoms,
 $\Delta E_{\text{light}} + \Delta E_{\text{atom}} = 0$, that is $\Delta E_{\text{light}} = -\Delta E_{\text{atom}}$

Emission of light:
 Light gains (a photon of) energy, $\Delta E_{\text{light}} = hc/\lambda$
 Atom electron cloud loses energy, $\Delta E_{\text{atom}} = -hc/\lambda$

BOSTON UNIVERSITY 40

[Quiz] A student asked, "I understand the transfer of a photon of energy takes about 100,000 oscillations of the electric field. But won't the photon have moved away from the atom in that time." A good answer to this question is ...

20% 1. The photon is attracted to the atom and so stays close by.

20% 2. The atom moves back and forth with the photon.

20% 3. It is the tugs of the electric field that transfer the energy.

20% 4. The photon disappears after the first electric field oscillation, but its energy doesn't appear in the atom until all of the field oscillations are complete.

20% 5. Some other answer.
