Things you should know when you leave Discussion today for one-electron atoms:

- \( E_n = \left(-\frac{R_y}{n^2}\right) \frac{Z^2}{n^2} = \left(-2.179 \cdot 10^{-18}\right) \frac{Z^2}{n^2} = \left(-13.6 \text{ eV}\right) \frac{Z^2}{n^2} \)
- \( \Delta E_{\text{matter}} = E_n - E_m \); Ionization Energy (IE) = \( E_\infty - E_{n(\text{initial})} \)
- \( \Delta E_{\text{light}} = h\nu_{\text{light}} = \text{IE} + \text{KE} \)

1. Consider the following energy levels of the hydrogen atom as shown below in the diagram:
   a. Sketch electron clouds corresponding to energy levels up to \( n = 3 \):

   ![Diagram of electron clouds for n = 1 to 3]

   b. When electron cloud of the H atom at the lowest energy interacts with light of the lowest resonate frequency, sketch the resulting electron cloud(s):

   ![Resulting electron cloud(s) diagram]

   c. When electron cloud of the H atom at the lowest energy interacts with light of the 2\textsuperscript{nd} lowest resonate frequency, sketch the resulting electron cloud(s):

   ![Resulting electron cloud(s) diagram]

   d. When electron cloud of the He atom at the lowest energy interacts with light of the lowest resonate frequency, sketch the resulting electron cloud(s):

   ![Resulting electron cloud(s) diagram]

   e. What are the two energy levels involved in the ionization energy of an electron from H in the ground state?

   f. What is the ground state H atom ionization energy in J, eV and kJ/mol? \( H(g) \rightarrow H^+(g) + e^- \)

   g. What is the expression for the ionization energy of an electron from the \( n = 3 \) state of a one electron atom with atomic number \( Z \)?
2. Hypothetical atom, X, has the following **ground state absorption** spectrum displayed below, and the ground state ionization energy of the atom is 15 eV (IE). Each of the **absorption** lines corresponds to a natural frequency of the electron cloud resulting from the mixing of electron wave with 1 loop with electron wave with more than one loop (i.e. the atom always starts in its ground state during each absorption). In answering the following questions, assume that the zero of energy is the ionized atom

\[ X \rightarrow X^+ + e^- \]

![](image)

**a.** What is the energy of the ground state (of the electron cloud corresponding to one loop) of X? **Hint: pay attention to the sign**

**b.** Construct the energy level diagram for X. **Hint:** How many energy levels are necessary to account for the **absorption** spectrum?

**c.** Using the energy level diagram you just drew: How many emissions **are possible** in the electrically-excited emission spectrum of this atom?

**d.** What is the energy of the *third excited* state of X? How many loops does that state have?

**e.** What is the energy of the *highest energy state* of X that is necessary to account for the **absorption** spectrum?

**f.** Is it possible for an electron in the ground state of atom X to absorb light of energy 3 eV or will it be transparent to it?
g. Can atom X emit light of energy 3 eV?

h. Is it possible for X to absorb light of energy 16 eV or will it be transparent to it? Why?

i. Can atom X emit light of energy 16 eV?

j. What is the lowest frequency of the light emitted from the atom?

k. Draw the emission spectrum:

l. At home: Calculate the kinetic energy of an electron (in Joules) that was ionized by light of frequency of $5 \cdot 10^{15} \text{Hz}$ from the ground state. 
   
   Hint: Remember that energy must be conserved. $(1.6021766 \cdot 10^{-19} \text{J} = 1 \text{eV})$

3. What is the expression for the energy (in J) for the ground state of an electron cloud in Li$^{2+}$?

   a. Calculate wavelength (in nm) of the light corresponding to the Li$^{2+}$ electron cloud resulting from mixing a 3 loop electron wave with a 1 loop electron wave?

4. Photons of energy $13.6 \text{eV} = R_y$ are able to ionize H in its $n = 1$ energy level. Are photons of this energy are able to ionize He$^+$ in its $n = 2$ energy level?

5. The photoelectric effect threshold frequency of a metal is $\nu_0 = 1 \cdot 10^{15} \text{Hz}$. Gamma radiation of frequency $1 \cdot 10^{17} \text{Hz}$ ejects electrons from the metal. Which of the following occurs when the intensity of the gamma radiation is reduced by 50.0%?

   a. The velocity of the ejected electrons will be reduced by a factor of two.
   b. The kinetic energy of the ejected electrons will be reduced by a factor of two.
   c. The kinetic energy of the ejected electrons will be reduced by a factor of four.
   d. Kinetic energy and the velocity of the ejected electrons will stay the same.
   e. Number of ejected electrons will increase.
   f. Number of ejected electrons will decrease.

6. Assume light is able to eject electrons from a metal. What do you expect as the wavelength of the light is increased?
   a. If the light wavelength reaches the lowest, electrons will no longer be ejected.
b. Electrons will still be ejected but they will move faster and faster.
c. Electrons will still be ejected but they will move slower and slower.
d. More and more electrons will be ejected but they will have the same kinetic energy.
e. More information needed.

7. One atom emits light of energy 1.27 eV. A second atom has only three energy levels: -0.9 eV, -1.27 eV, and -1.9 eV. Assuming ionization is not possible can the second atom absorb the light emitted by the first atom.

8. For the two hydrogen electron clouds below identify the quantum number "n", the quantum number “l”, the number of radial loops “j”, and the specific name of the orbital (you must indicate orientation, e.g. 3d<sub>xy</sub>).

![Diagram of electron clouds](image)

- A
  - n =
  - l =
  - j =
  - Name: ______________

- B
  - n =
  - l =
  - j =
  - Name: ______________

a. For the two hydrogen electron clouds above, which has the largest ionization energy? *Note: in H atom, all orbitals of the same n have the same energy.*

9. What are the possible angular momentum quantum numbers for an orbital in the n=4 shell?

a. How many degenerate orbitals are in the n=3 shell? What are they? *Note: in H atom, all orbitals of the same n have the same energy.*

10. The figure shows three H atom electron clouds.

a. Which of the following H atom electron clouds has the largest ionization energy?

b. Write down the numerical expression that when evaluated gives the value in eV of smallest ionization energy of these three clouds.

![Diagram of electron clouds](image)

- A
- B
- C

**Things you should know when you leave Discussion today for multi-electron atoms:**
- Many electron system Mahaffy, 2e section 8.4
- Electron configurations Mahaffy, 2e section 8.5
• Shielding and effective nuclear charge: Mahaffy, 2e section 8.6
  \[ E_n = \left(-R_y\right) \frac{Z_{\text{eff}}^2}{n^2} = (-13.6 \text{ eV}) \left(-2.179 \times 10^{-18}\right) \frac{Z_{\text{eff}}^2}{n^2} = (-1312 \frac{\text{kJ}}{\text{mol}}) \frac{Z_{\text{eff}}^2}{n^2} \]
• Periodicity: Mahaffy, 2e section 8.7

1. Below is a plot of the first 10 ionization energies for a single atom in 3rd row of the periodic table. The x-axis shows which ionization (e.g. IE₁, IE₂, etc.) and the y-axis gives how much energy in (MJ/mol).

   a. What 3rd row element does the plot show?

   b. First ionization energy IE₁ is 10.36 eV calculate \( Z_{\text{eff}} \) for that element. Note: We will not use Slater’s rules for \( Z_{\text{eff}} \), so please ignore Mahaffy et al., section 8.6, pages 289 to 291. (Useful information: 1eV = 1.6021766 \times 10^{-19} \text{ J}; N_\Lambda = 6.022140857 \times 10^{23} / \text{mol})

\[
\text{IE} = E_{\infty} - E_{\text{initial}} = (2.179 \times 10^{-18}) \frac{Z_{\text{eff}}^2}{n^2} = (13.6 \text{ eV}) \frac{Z_{\text{eff}}^2}{n^2} = (1312 \frac{\text{kJ}}{\text{mol}}) \frac{Z_{\text{eff}}^2}{n^2}
\]

   c. The arrow points to the jump between the 6th and 7th ionization energy. Which of the following statements are true?
      i. The number of protons (\( Z \)) changed.
      ii. The effective nuclear charge (\( Z_{\text{eff}} \)) changed.
      iii. The quantum number \( n \) of the electron that is ionized changed.
      iv. The radius of the ion decreased

2. From the following three different neutral atoms electron configurations, label the one with the highest third ionization energy, and lowest third ionization energy. Explain your
answers. Hint: remember that number of electrons in the neutral atom equals the number of protons.

a. $1s^2 \ 2s^2 \ 2p^6 \ 3s^2 \ 3p^6 \ 4s^2$

b. $1s^2 \ 2s^2 \ 2p^6 \ 3s^2 \ 3p^6 \ 4s^1$

c. $1s^2 \ 2s^2 \ 2p^6 \ 3s^2 \ 3p^6$

3. Which one will have the greatest ionization energy: Na+, Ne, F-, O2-?

4. Answer the following questions about manganese (Mn):

a. What is the electron configuration?

b. First ionization energy $IE_1$ is 7.43 eV calculate $Z_{eff}$ for that element.

c. Circle the letters corresponding to the picture of occupied electron clouds. Hint: you need to know what are $n$, $l$, and $j$ for one electron in each of the occupied electron clouds.

For the above, fill in the empty boxes on the graphs on the next page with corresponding names of the orbitals (1s, 2s, 3s, 4s, 2p, 3p, 3d):
d. Use the radial probability densities on the next page (electron cloud cross section below) to estimate the size of an atom of Mn. Hint: Look at the x axis.

Additional Practice

1. What electron cloud energies account for the line wavelength 434 nm in the gas discharge spectrum for atoms? (In the Balmer series of H Balmer series in each of the lines corresponds to a frequency of the electron from the mixing of an electron wave with the
1. Only the $n = 3$ cloud energy
B. Only the $n = 4$ cloud energy
C. Only the $n = 5$ cloud energy
D. The $n = 2$ and $n = 4$ cloud energies
E. The $n = 2$ and $n = 5$ cloud energies
F. None of these.

2. The ionization wavelength of H atom in the $n = 2$ energy level is 365 nm. Will light of this wavelength ionize He$^+$ in the $n = 1$ level?

3. The light with wavelength of 365 nm will ionize H atom in the $n = 2$ energy level. What effect will light with wavelength 657 nm have? (Choose all that apply.)
   a. Atom will be transparent to the light of this wavelength
   b. Ionization will take place
   c. Ionization will not take place
   d. The ionized electron will use excess energy for kinetic energy

4. The light with wavelength of 365 nm will ionize H atom in the $n = 2$ energy level. What effect will light with wavelength 265 nm have? (Choose all that apply.)
   a. Atom will be transparent to the light of this wavelength
   b. Ionization will take place
   c. Ionization will not take place
   d. The ionized electron will use excess energy for kinetic energy

5. An electron is ionized from the ground state of an atom, with $E_1 = -30$ eV, by light for which a photon of light energy is 36 eV. What is the kinetic energy (in eV) of the ejected electron?

6. What is kinetic energy of the electron ionized from Li$^{2+}$ in its $n = 6$ level by light of wavelength 310 nm?

7. In terms of the variables (i.e. $R_y$, $h$, and $c$) what is the smallest possible wavelength of light that will be emitted by a He$^+$ atom starting with the energy corresponding to 6 loops?

8. What is the largest possible wavelength of light that will be emitted by be the Li$^{2+}$ atom with the energy level corresponding to 6 loops.

9. An electron is ionized from the ground state of an atom, with $E_1 = -1.3\cdot10^{-19}$ J, by light with frequency $1.0\cdot10^{15}$ Hz. What is the kinetic energy (in eV) of the ejected electron?

10. The work function (ionization energy), of chromium metal is $7.2\cdot10^{-19}$ J.
   a. What is the maximum kinetic energy of an electron, if it is ejected from chromium metal by light of wavelength 250. nm?
   b. What will happen to the speed and quantity of the ejected electrons if the wavelength of the light will increase?
   c. What will happen to the speed and quantity of the ejected electrons if the wavelength of the light will decrease?
d. What will happen to the speed and quantity of electrons if the intensity of the light will increase?

11. An atom has only three energy levels, -2.5, -4.0, and -4.5 eV. Draw the absorption spectrum for a gas of these atoms excited by an electric discharge. Hint: you need to draw energy level diagrams to answer this question assume the most negative energy is an energy of the ground state

   a. Draw the emission spectrum. Hint: does it always just go to the ground state?

12. An atom has only three energy levels, -2.6, -4.1, and -5 eV. Draw the absorption spectrum for a gas of these atoms excited by an electric discharge.

   a. List all the lines in the emission spectrum. Do not assume that it always goes to the ground state.

13. An atom has energy levels of -2.2 \times 10^{-18} J, -5.5 \times 10^{-19} J, -2.5 \times 10^{-19} J, -1.4 \times 10^{-19} J, -8.7 \times 10^{-20} J, and -6.1 \times 10^{-20} J.

   a. Calculate the \lambda (in nm) of light that is necessary to excite an electron to E_{\infty} from E_2.
   b. What is the \lambda (in nm) of light necessary to excite an electron to E_3 from E_2?
   c. How many emission lines (in total) are possible for an atom with these energy levels?
   d. How many ground-state absorption lines are possible for an atom with these energy levels?

14. Draw the electron configuration diagram for C, but fill the diagram as if the C is in the ground state. Draw a dotted line around a shell. Circle a subshell. Draw a triangle around an orbital. Is C atom paramagnetic or diamagnetic?

   a. Calculate \( Z_{\text{eff}} \) of C, if \( IE_1 = 1086 \text{ kJ/mol} \). (Hint: \( IE= E_{\infty}-E_{\text{initial}} = (2.179 \times 10^{-18} J) \frac{Z_{\text{eff}}^2}{n^2} \))

15. Rank the following in terms of increasing ionization energy: Na, Li, B, N, Ne

16. Rank the following in terms of increasing ionization energy: Li^+, B^+, N^+, Ne^+, Na^+

17. Write the ground state electron configuration for the following atoms and ions and determine if each is paramagnetic or diamagnetic: Al, Al^{3+}, V, V^{3+}

Exam 3 Answers:

1. 4.6 kJ
2. 12C(s, graphite) + 11H₂(g) + 11/2 O₂(g) → C₁₂H₂₂O₁₁(s)
3. 6C(s, graphite) + 9H₂(g) + 3/2 O₂(g) → CH₃CH₂OH(l)
4. 
   a. -57.05 kJ/mol
   b. 228.2 kJ/mol
   c. -10.86 kJ
5. -694 kJ/mol
6. -6 kJ/mol
7. 
   a. 1.81*10⁻¹⁰ s
   b. 656 nm
   c. -276 KJ
8. \(q_{sys} < 0; q_{sur}> 0; w < 0; \Delta T_{sur}> 0; \) \(T_{final \ (const. \ pressure)} < T_{final \ (const. \ volume)} \)
9. 3, 4, 2
   0, 2, 1
   3s, 4d, 2p
   1, 5, 3
   B
10. 23.2°C
11. 0 J
12. F, F, T, F, F
13. 37.4 kJ/mol
