## Lecture 33 CH102 A1 (MWF 9:05 am)

Wednesday, April 19, 2017

- Spontaneity of phase transitions: water  $\rightleftharpoons$  steam
- $\Delta S$  picture colligative properties: Freezing point depression

**Next lecture:** Absolute entropy. Entropy change of reaction. System-only measure of total entropy change:  $\Delta G$ . Using temperature to change spontaneity:  $\Delta G$  versus  $T$ . The three faces of  $\Delta G$ . Using temperature to change equilibrium:  $K$  versus  $T$ .

## A non-chemistry question

With apologies for a question **not related to our course**, ...  
if you are taking a course in linear algebra, or plan on doing so soon, ...  
please email Dan Dill, [dan@bu.edu](mailto:dan@bu.edu), with subject line "**linear algebra**".  
Thank you.

## Taking stock

Spontaneity **means** that ...  

$$\Delta S_{\text{tot}} = \Delta S_{\text{sys}} + \Delta S_{\text{surr}} > 0$$

Spontaneity **does not** require that ...  

$$\Delta S_{\text{sys}} > 0 \text{ or } \Delta S_{\text{surr}} > 0$$

A neat illustration of the **separate roles** of  $\Delta S_{\text{sys}}$  and  $\Delta S_{\text{surr}}$  is understanding why **steam condenses** and **water boils**

## steam $\rightarrow$ water at 94 °C

Super cooled steam at 94 °C condenses **spontaneously** to water.

Spontaneity means  $\Delta S_{\text{tot}} > 0$

But "gas  $\rightarrow$  liquid" means  $\Delta S_{\text{sys}} < 0$

This means it must be  $\Delta S_{\text{surr}}$  that makes  $\Delta S_{\text{tot}} > 0$

How to get  $\Delta S_{\text{surr}}$ ?

**The trick:**  $\Delta S_{\text{surr}} = \Delta H_{\text{surr}} / T = -\Delta H_{\text{sys}} / T$

Hence we can always write  $\Delta S_{\text{tot}} = \Delta S_{\text{surr}} + \Delta S_{\text{sys}}$  as

$$\Delta S_{\text{tot}} = -(\Delta H_{\text{sys}} / T) + \Delta S_{\text{sys}}$$

## steam $\rightarrow$ water at 94 °C

$$\Delta S_{\text{tot}} = -\Delta H_{\text{sys}} / T + \Delta S_{\text{sys}}$$

At 100 °C, steam and water are **in equilibrium**, so ...

$$\Delta S_{\text{tot}} = 0 = +\Delta H_{\text{vap}} / (373 \text{ K}) + \Delta S_{\text{sys}}$$

From this we know that  $\Delta S_{\text{sys}}$  ...

$$= -\Delta H_{\text{vap}} / (373 \text{ K})$$

$$= -(40.65 \times 10^3 \text{ J/mol}) / (373 \text{ K}) = -108.9 \text{ J/(mol K)}$$

For **other temperatures**  $\Delta S_{\text{tot}}$  ...

$$= + (40.65 \times 10^3 \text{ J/mol}) / T - 108.9 \text{ J/(mol K)}$$

### How to determine $\Delta S_{\text{sys}}$ for a chemical reaction?

We have seen that we can get  $\Delta S_{\text{sys}}$  for a phase transition using  $\Delta S_{\text{tot}} = 0$  at the transition temperature.

Getting  $\Delta S_{\text{sys}}$  for a chemical reaction requires a different approach.

In principle we could get  $\Delta S_{\text{sys}}$  by analyzing changes in particle and energy dispersal in the reaction.

But, in practice, it is easier to get  $\Delta S_{\text{sys}}$  by measuring heat flow between system and surroundings when they are in equilibrium.

At equilibrium,  $\Delta S_{\text{tot}} = 0$ , and so ...

$$\Delta S_{\text{sys}} = -\Delta S_{\text{sur}} = -\Delta H_{\text{sur}}/T = +\Delta H_{\text{sys}}/T$$

BOSTON UNIVERSITY 36
