Problem 7e and 8e 13.31

$$\Delta G_{\text{vap}} = \left[\frac{38.7 \text{ kJ}}{\text{mol}} \right] - \left[\frac{273 \text{ K}}{\text{mol}} \times \frac{38.7 \text{ kJ}}{\text{mol}} \right] = 0$$

31. Ethanol's enthalpy of vaporization is 38.7 kJ mol^{-1} at its normal boiling point, 78°C . Calculate q , w , ΔU , ΔS_{sys} , and ΔG when 1.00 mol ethanol is vaporized reversibly at 78°C and 1 atm . Assume that the vapor is an ideal gas and neglect the volume of liquid ethanol relative to that of its vapor.

$$q = 38700 \text{ J}$$

$$w = -P \Delta V = -\Delta n_g RT$$

$$\Delta H = q + w$$

$$\Delta S = \frac{\Delta H}{T}$$

$$w = -1 \text{ mol} \times 8.314 \frac{\text{J}}{\text{mol K}} \times (273 + 78) \text{ K}$$

$$= -2.92 \text{ kJ}$$

$$\Delta U = 38.7 \text{ kJ} - 2.92 \text{ kJ} = 35.8 \text{ kJ}$$

Atomic or molecular oxygen?

At what temperature will oxygen spontaneously decompose, $\text{O}_2(g) \rightarrow 2 \text{O}(g)$?

- $\Delta H_f(\text{O}, g) = 249.2 \text{ kJ/mol}$
- $S^\circ(\text{O}, g) = 161.1 \text{ J/(K mol)}$
- $S^\circ(\text{O}_2, g) = 205.0 \text{ J/(K mol)}$

$$\Delta G = \Delta H - T \Delta S$$

$$\Delta H = 2 \Delta H_f(\text{O}, g) - \Delta H_f(\text{O}_2, g)$$

$$\Delta S = 2 S^\circ(\text{O}, g) - S^\circ(\text{O}_2, g)$$

How to proceed?

At 300 K, ΔH

$$\Delta G = 2 \times 249.2 - 300 \text{ K} \times 10^{-3} (2 \times 161.1 - 205.0) = +463 \text{ kJ}$$

Since > 0 , not spontaneous, so mostly molecules at 300 K

4

Atomic or molecular oxygen?

At what temperature will oxygen spontaneously decompose, $O_2(g) \rightarrow 2 O(g)$?

At 300 K,

$$\Delta G = 2 \times 249.2 - 300 \text{ K} \times 10^{-3} (2 \times 161.1 - 205.0) = +463 \text{ kJ}$$

At what T will decomposition become spontaneous?

$$\Delta G = 0 = 2 \times 249.2 - T \times 10^{-3} (2 \times 161.1 - 205.0)$$

$$T = 2 \cdot 249.2 \times 10^3 / (2 \times 161.1 - 205.0) = 4253 \text{ K}$$

So, for T above 4253 K, mostly atoms

Atomic or molecular oxygen?

At what temperature will oxygen spontaneously decompose, $O_2(g) \rightarrow 2 O(g)$?

OK, we have seen that

- at low T oxygen is mostly molecules,
- but at high T it is mostly atoms.

Why?

Even though breaking the molecule apart raises the entropy of the system, it takes energy from surroundings to break bonds and so entropy of surroundings is lowered.

But, high temperature mutes lowering of S_{sur} .

$\Delta S_{tot} = \Delta S_{sys} + \Delta S_{sur}$
 $O_2 \rightarrow 2O$
 $\Delta S_{sys} > 0$
 $\Delta S_{sur} < 0$
 $\Delta S = \frac{\Delta H}{T}$

BOSTON UNIVERSITY 6

[TP] At 300 K, hydrogen and oxygen react explosively to form water. The free energy of formation of water is -237 kJ. Based on this information, at very high temperature, water will ...

71% 1. decompose into H_2 and O_2
 24% 2. will not decompose into H_2 and O_2
 6% 3. More information needed

$H_2(g) + \frac{1}{2} O_2(g) \rightarrow H_2O(l) \quad \Delta G_f^\circ = -237 \text{ kJ}$
 $H_2O \rightarrow H_2 + \frac{1}{2} O_2 \quad \Delta G_f^\circ = +237 \text{ kJ}$
 $\Delta H > 0$
 $\Delta G_f^\circ = \Delta H - T \Delta S$
 $\Delta H < 0$
 $\Delta S > 0$

ΔG versus T

$\Delta G = \Delta H - T \Delta S = b + m x$

Intercept $b = \Delta H$, slope $m = -\Delta S$, $x = T$

Sketch the four families of lines ΔG versus T , distinguished by the signs of b and of m .

- $b = \Delta H > 0$ slope $m = -\Delta S < 0$
- $b = \Delta H > 0$ slope $m = -\Delta S > 0$
- $b = \Delta H < 0$ slope $m = -\Delta S < 0$
- $b = \Delta H < 0$ slope $m = -\Delta S > 0$

Which family corresponds to H_2 burning in air?

Spontaneity of "reactants" \rightarrow "products" $R \rightarrow P$

If products (right side) increase with time, we say the reaction is **spontaneous**.

If reactants (left side) increase with time, we say the reaction is **nonspontaneous**.

If the amount of reactants and products do not change with time, we say the reaction is **at equilibrium**.

Reaction quotient Q measures progress

For $A \rightarrow B + C$, the reaction quotient is ... $Q = \frac{[B][C]}{[A]}$

$Q = \frac{[B][C]}{[A]}$

The numerical value of the reaction quotient when the concentrations have their equilibrium values ... $[A]_e$, $[B]_e$ and $[C]_e$

and so no longer change with time, is called the equilibrium constant ...

$K = \frac{[B]_e[C]_e}{[A]_e}$

Practice: Problem 14.5

$K = \frac{P_{CO_2} P_{H_2}}{P_{CO} P_{H_2O}} = 3.9$

CO H₂O CO₂ H₂
 0.10 0.10 0.70

$K = \frac{0.70 \times P_{H_2}}{(0.10)(0.10)} = 3.9$

$P_{H_2} = \frac{3.9 \times 0.01}{0.70} =$

5. An important step in the industrial production of hydrogen is the reaction of carbon monoxide with water:

$CO(g) + H_2O(g) \rightleftharpoons CO_2(g) + H_2(g)$

(a) Use the law of mass action to write the equilibrium expression for this reaction.

(b) At 500°C, the equilibrium constant for this reaction is 3.9. Suppose that the equilibrium partial pressures of CO and H₂O are both 0.10 atm and that of CO₂ is 0.70 atm. Calculate the equilibrium partial pressure of H₂(g).

$K = \frac{(P_{H_2})}{(P_{H_2O})^2 P_{CO_2}}$

BOSTON UNIVERSITY

Practice: Problem 14.11

11. Using the law of mass action, write the equilibrium expression for each of the following reactions.

(a) $\text{Zn}(s) + 2 \text{Ag}^+(aq) \rightleftharpoons \text{Zn}^{2+}(aq) + 2 \text{Ag}(s)$

(b) $\text{VO}_4^{3-}(aq) + \text{H}_2\text{O}(\ell) \rightleftharpoons \text{VO}_3(\text{OH})^{2-}(aq) + \text{OH}^-(aq)$

(c) $2 \text{As}(\text{OH})_6^{3-}(aq) + 6 \text{CO}_2(g) \rightleftharpoons \text{As}_2\text{O}_3(s) + 6 \text{HCO}_3^-(aq) + 3 \text{H}_2\text{O}(\ell)$

a) $K = \frac{[\text{Zn}^{2+}]}{[\text{Ag}^+]^2} = \frac{[\text{Zn}^{2+}]}{[\text{Ag}^+]^2}$

b) $K = \frac{[\text{VO}_3(\text{OH})^{2-}][\text{OH}^-]}{[\text{VO}_4^{3-}]}$

c) $K = \frac{[\text{HCO}_3^-]^6 (P_{\text{CO}_2})^6}{[\text{As}(\text{OH})_6^{3-}]^2}$

Q versus K is the key to assessing spontaneity

If $Q < K$, product must form to get to equilibrium,
so **spontaneous**

If $Q > K$, reactants must form to get to equilibrium,
so **nonspontaneous**

[TP] The figure shows how the partial pressures of the N_2O_4 and NO_2 **change with time** due to the chemical reaction

$$N_2O_4 \rightleftharpoons 2 NO_2$$

for **certain initial conditions**. At these **initial conditions**, the following is known about the chemical reaction.

- 73% 1. It is **spontaneous**
- 7% 2. It is **at equilibrium**
- 0% 3. It is **non-spontaneous**
- 20% 4. Its spontaneity is **not known** without further information

21

Lecture 13 CH131 Summer 1 2019 Copyright © 2019 Dan Dill dan@bu.edu

[TP] At the **initial conditions** for the reaction

$$N_2O_4 \rightleftharpoons 2 NO_2$$

the following is known about the ratio Q/K .

- 20% 1. It is **greater** than 1
- 7% 2. It is **equal** to 1
- 73% 3. It is **less** than 1
- 0% 4. The ratio is not known without further information

$Q = \frac{0}{\neq 0} = 0 < K$
 $Q/K < 1$

22

Lecture 13 CH131 Summer 1 2019 Copyright © 2019 Dan Dill dan@bu.edu

[TP] For the reaction

$$N_2O_4 \rightleftharpoons 2 NO_2$$

which curve on the right shows the corresponding **change of Q with time**?

- 82% 1. 1
- 6% 2. 2
- 0% 3. 3
- 12% 4. 4
- 0% 5. None

23

Lecture 13 CH131 Summer 1 2019 Copyright © 2019 Dan Dill dan@bu.edu

[Quiz] The figure shows how the partial pressures of the N_2O_4 and NO_2 **change with time** due to the chemical reaction

$$N_2O_4 \rightleftharpoons 2 NO_2$$

for **certain initial conditions**. At these **initial conditions**, the following is known about the chemical reaction.

- 6% 1. It is **spontaneous**
- 0% 2. It is **at equilibrium**
- 94% 3. It is **non-spontaneous**
- 0% 4. Its spontaneity is **not known** without further information

24

Practice: Problem 14.25

25. Sulfuryl chloride (SO_2Cl_2) is a colorless liquid that boils at 69°C . Above this temperature, the vapors dissociate into sulfur dioxide and chlorine:

$$\text{SO}_2\text{Cl}_2(\text{g}) \rightleftharpoons \text{SO}_2(\text{g}) + \text{Cl}_2(\text{g})$$

This reaction is slow at 100°C , but it is accelerated by the presence of some FeCl_3 (which does not affect the final position of the equilibrium). In an experiment, 3.174 g of $\text{SO}_2\text{Cl}_2(\ell)$ and a small amount of solid FeCl_3 are put into an evacuated 1.000-L flask, which is then sealed and heated to 100°C . The total pressure in the flask at that temperature is found to be 1.30 atm .

(a) Calculate the partial pressure of each of the three gases present.
 (b) Calculate the equilibrium constant at this temperature.

$P_0 = \frac{n_0 RT}{V} = \frac{3.174 \text{ g}}{1.000 \text{ L}} \cdot \frac{1}{1.000} \cdot R \cdot 373 \text{ K} = 0.720 \text{ atm}$

	SO_2Cl_2	SO_2	Cl_2	P_{tot}
P_0	0.720	0	0	0.720
Change	$-x$	$+x$	$+x$	
Equilibrium	$0.720 - x$	x	x	1.30

$1.30 = 0.720 - x + 2x = 0.720 + x$
 $x = 1.30 - 0.720 = 0.58$
 $K = \frac{x^2}{0.720 - x} = \frac{(0.58)^2}{0.720 - 0.58} = 2.4$

BOSTON UNIVERSITY

Lecture 13 CH131 Summer 1 2019 Copyright © 2019 Dan Dill dan@bu.edu

Practice: Problem 14.33

33. At 25°C , the equilibrium constant for the reaction

$$\text{N}_2(\text{g}) + \text{O}_2(\text{g}) \rightleftharpoons 2 \text{NO}(\text{g})$$

is $K = 4.2 \times 10^{-31}$. Suppose a container is filled with nitrogen at an initial partial pressure of 0.41 atm , oxygen (at an initial partial pressure of 0.59 atm), and nitrogen oxide (at an initial partial pressure of 0.22 atm). Calculate the partial pressures of all three gases after equilibrium is reached at this temperature.

① Make ICE table first time
 ② Assess Q vs K . If $Q < K$, make product with $-E$
 ③ Use E row to solve for unknown.

	N_2	O_2	2NO	Q
I	0.41	0.59	0.22	$0.20 \gg K$
C	$+x$	$+x$	$-2x$	
E	$0.41+x$	$0.59+x$	$0.22-2x$	0

$K = \frac{(0.22-2x)^2}{(0.41+x)(0.59+x)}$

RI $0.41+x$ $0.59+x$ 0 $Q=0 < K$

C $-y$ $-y$ $+2y$

E $0.52-y$ $0.70-y$ $2y$

$K = \frac{(2y)^2}{(0.52-y)(0.70-y)} \Rightarrow y = \sqrt{\frac{K \cdot 0.52 \cdot 0.70}{4}} = 1.96 \times 10^{-16}$

BOSTON UNIVERSITY
